

NEW YORK STATE SENATOR

Liz Krueger

State Senate Passes Maternal Depression Treatment Bill

LIZ KRUEGER June 7, 2017

| ISSUE: **MATERNAL DEPRESSION**

Albany – Today the State Senate unanimously passed S4000, sponsored by Senator Liz Krueger, which would improve treatment options for women diagnosed with maternal depression. The bill is carried in the Assembly by Assembly Member Diana C. Richardson (A8308).

"Having a baby can be an incredible and rewarding experience for moms and families, but it is also a very challenging time," said **Senator Krueger**. "1 in 10 new mothers will experience

symptoms of maternal depression, and too many of them will suffer in silence. This bill will improve access to treatment so that women can get the resources they need to overcome maternal depression. I thank my Senate colleagues for their support. Maternal depression is very treatable, and New Yorkers need to know that there is help available."

S4000/A8308 would require the creation of a centralized list of available community resources, peer support groups, and providers who treat maternal depression, which would help providers conducting screenings make appropriate referrals and get more women access to treatment. The bill also requires the state to invest in maternal depression treatment resources including strengthening and expanding a statewide hotline, encouraging peer support and telemedicine options, and improving the capacity of referral networks.

In 2014, Senator Krueger and Assembly Member Richard Gottfried sponsored legislation, which passed unanimously in both houses of the Legislature and was signed into law by Governor Cuomo, to provide education and promote screening and treatment-referrals for maternal depression. Maternal depression includes a range of perinatal mood disorders, emotional and psychological reactions a woman may experience during pregnancy or up to a year after childbirth. Symptoms can include feelings of despair or guilt, sadness, fatigue, difficulty concentrating, changes in appetite, and thoughts of suicide or of harming the baby. Maternal depression includes prenatal depression, "baby blues," postpartum anxiety, postpartum depression, and postpartum psychosis. The latter is the most severe of these conditions, often including hallucinations and delusions, and results in infanticide and suicide rates of four and five percent, respectively.

Maternal depression affects a significant portion of pregnant women and new mothers; in fact, it is one of the most common medical complications women may experience during and

after pregnancy. Each year, approximately 10 to 15 percent of new mothers develop postpartum depression, while 50 to 80 percent of new mothers will experience “baby blues.” A small but significant number – about 0.1 to 0.2 percent of new mothers – develop symptoms serious enough to be considered postpartum psychosis.

Maternal depression can lead to significant negative consequences for those affected and their families and children if left untreated. However, treatment for maternal depression has an 80 to 90 percent success rate. Early diagnosis and treatment significantly improve prognoses.
