New York State’s candidates for the legislature in 2012 raised 76% of their money (through the final pre-election disclosure reports) from donors who gave them \$1,000 or more, and from interest groups. Only 8% came from donors who gave \$250 or less. The balance between the state’s small versus large donors was almost the same in 2012 as in 2010 and 2008.

“There is no question that big donors dominate the Empire State’s politics,” said CFI’s Executive Director Michael J. Malbin, who is also a professor of political science at the University at Albany (SUNY). The figures were released by CFI in conjunction with Malbin’s December 3 appearance on a panel co-sponsored by the SUNY’s Rockefeller Institute of Government and the League of Women Voters of New York.

Gov. Andrew Cuomo of New York has recommended that the state reduce candidates’ dependence on big donors by adopting a system of small-donor matching funds similar to New York City’s. The city provides \$6 in matching funds for each of the first \$175 that a donor gives to a candidate participating in its voluntary system. (Gov. Cuomo also proposed lower contribution limits, improved disclosure, and strengthened enforcement.) In April 2012, Assembly Speaker Sheldon Silver and Senate Democratic Leader John Sampson introduced bills providing six-for-one matching funds for a donor’s first \$250, with lower contribution limits.

CFI’s previous studies of New York have shown that matching funds could have a profound effect on the state’s election financing. The first was a broad peer-reviewed policy analysis published in *Election Law Journal* ([link](#)). The second showed that small donors would likely be responsible for a majority of the candidates’ funds under a small donor matching system ([link](#)). A third ([link](#)), published jointly with the Brennan Center, shows that New York City’s system brings a far more diverse pool of donors into the system than traditional fundraising.

These earlier studies focused on the potential benefits of small donor matching funds. The current one addresses concerns about two of the potential costs. It shows, first, that the financial costs have been vastly overstated. Second, it shows that almost every candidate for the state legislature would be better off with public matching funds replacing high contribution limits than they are with the status quo.

FINANCIAL COST

Perhaps the most controversial claim is about financial cost. For example, the Senate’s Majority Leader, Dean Skelos, referred in 2012 to the cost of a public matching system as being \$200 million per election or \$100 million per year. In contrast, the Campaign Finance Institute’s recently completed analysis suggests the cost would be more like \$25-\$40 million per year. To arrive at these estimates, CFI assumed the matching fund formulae and contribution limits of the Silver-Sampson bill and applied them to the actual donors in the elections of 2010. (CFI will

info@CFInst.org
CampaignFinanceInstitute.org

re-estimate the cost with 2012 donors when the final reports are available, but a preliminary review suggests there should not be much change.)

The CFI analysis assumed that all donors who gave in 2010 would continue to give the same amounts under the new system – but only up to the new contribution limit. To average the cost between a gubernatorial and midterm election, the analysis includes one election for statewide officials and two elections for the legislature. It then assumed four different scenarios, represented in the table below. The two variables producing the four scenarios have to do with the rules for contested primaries, and the presence or absence of new donors in the system.

The Silver-Sampson bill would allow higher contribution limits and public funding ceilings for a candidate who is challenged in a primary election than for one who is not. This results in two pairs of scenarios. For one, we assume a *status quo* in which only the few candidates who were actually challenged in 2010 would continue to be challenged under the new system. Under the other scenarios, we assume a substantial increase in primary challenges. By definition, this assumption would mean that the rules were bringing new candidates into the system. Obviously, we have no idea how many these might be. (Many incumbents presumably would still be unchallenged.) If we assume arbitrarily – and generously – that half of the current candidates would face a primary challenge under the new rules, we can estimate the cost by treating all of the existing incumbents as if they would be covered the under rules for contested primaries. This should produce overly high estimates of the new program’s cost.

Second, any cost estimate will be sensitive to the number of donors assumed. The table therefore includes two estimates of the number of donors. Under one, we calculate that only the donors who gave in 2010 continue to give under the new system. This produces a low estimate for public funding. The second assumes the program’s incentives successfully bring new donors into the system. To put a dollar figure on this, we make the optimistic assumption that each candidate doubles the amount she or he raises from small donors.

Table 1. The Cost of a Public Matching Fund System for New York State Elections
Includes the Four-Year cost for all Statewide and Legislative Candidates

All candidates assumed to receive public funds up to the maximum allowed for one contested election, usually the general election. In addition, for primary elections:	Same Donors as 2010, Lower Contribution Limit	Same Donors Plus Each Candidate Doubles the Amount of Small Donor Money Raised
Assume higher public funding cap only for those with two contests in 2010		
Total Four-Year Public Funding Cost	100,236,704	132,205,864
Average Public Funding Cost per Year	25,059,176	33,051,466
Average per year per capita	\$1.29	\$1.69
Treat every 2010 general election candidate as if in a contested primary		
Total Four-Year Public Funding Cost	119,315,080	165,214,488
Average Public Funding Cost per Year	29,828,770	41,303,622
Average per year per capita	\$1.53	\$2.12

The above table shows the CFI estimate under each of the four scenarios. If no new donors are brought into the system, the cost would be \$25 million - \$30 million per year. This would

average to \$1.29 - \$1.53 per person per year. With new donors, the cost would be \$33 million to \$41 million per year. Under these more expensive scenarios, therefore, the average cost for each of New York's 19.5 million residents would be between \$1.69 and \$2.12 per year, with the higher figure including generously optimistic assumptions for both of the key variables.

HOW THE CANDIDATES WOULD FARE

Under the Silver-Sampson bill, candidates would lose some of their current money from big donors because the contribution limits would be lower. They would also gain money from the new public matching funds. Incumbents who are asked to vote for such a program obviously would want to know whether combining the two provisions would leave them with less money and therefore less able to compete. As the following summary table indicates, almost all Assembly candidates would have ended up ahead with public funding and lower contribution limits. So would most Senate candidates, but the number would have been sensitive to the bill's specific provisions.

The Silver-Sampson bill would have imposed \$2,000 contribution limits on any candidate for any state office unless that candidate was challenged in a primary as well as running in the general election. For candidates facing a primary challenge and then running in the general the contribution limit would have been \$2,000 per election or \$4,000 combined. The bill also would have imposed a limit on the maximum amount of funds a candidate could receive. That limit was \$150,000 per election for the Assembly (or \$300,000 combined for both elections) and \$350,000 for the Senate (or \$700,000 combined).

The following table mixes and matches the two provisions, showing how many candidates would have been net losers if all candidates had operated under the higher or lower contribution limits, with the higher or lower public funding cap. It shows the results with the actual donors of 2010, and with a doubling of the money from small donors.

Table 2. Number of 2010 Candidates Who Would Have Had Less Money With Public Matching Funds and Lower Contribution Limits

	Total # Candidates	\$2,000 Contribution Limit		\$4,000 Contribution Limit	
		Same Donors	More small donors	Same Donors	More small donors
Assembly					
\$150,000 cap	246	2	2	1	1
\$300,000 cap	246	2	2	1	1
Senate					
\$350,000 cap	113	20	15	4	4
\$700,000 cap	113	19	11	1	1

As the table shows, the Silver-Sampson bill provides adequate public funds to assure that almost every candidate for the Assembly would have raised at least as much money by substituting small donor matching funds for large contributions. The bill is not as finely tuned for the Senate. By imposing the same contribution limits for all offices, the bill would have about one-quarter of all Senate incumbents (13 Democrats and 3 Republicans) with less money under the proposed

system than under the status quo. Most challengers and candidates for open seats would be ahead.

To address this, the bill's sponsors might want to vary the contribution limits across offices. The Silver-Sampson bill has the same contribution limit for Assembly, Senate and all statewide offices. In 2011-12, thirteen states had the same contribution limit for all offices, nineteen had higher limits for statewide officials and six (including New York) had different limits for statewide office and each of the two legislative chambers. (Twelve states allowed unlimited contributions.) New York's Senate districts are approximately twice as large as its Assembly districts. One possibility therefore might be to make the contribution limits for the Senate twice that of the Assembly's. (The Senate's current limit is about 2.5 times the Assembly's. A \$4,000 for the Senate and a \$2,000 for the Assembly would be about half of the current limit for both chambers.) If the Senate's contribution limits were \$4,000, almost all Senate candidates would find it advantageous to combine the new limits with small donor matching funds.

Appendix 1: Candidates for NY State Senate in 2010

Appendix 2: Candidates for NY State Assembly in 2010

Appendices 1 and 2 show: (a) the amount of Money Each Candidate Raised in 2010; (b) how much each candidate would lose as a result of the Silver-Sampson Bill's contribution limits; (c) how much new money each candidate would receive from public matching funds if the donors who gave in 2010 were to give again and no new donors entered the system; (d) how much each candidate would receive from public matching funds if the system did bring new donors into the system; (e) the net gain or loss to each candidate under the two public matching fund scenarios, as they are in the Silver-Sampson bill; and (f) for Senate candidates, the net gain or loss with higher contribution limits and/or higher public funding caps.

The total public funding cost in Table 1 above is derived by adding the funds for public funding for each individual candidate for statewide office as well as for the Assembly and Senate.
